VISION & MISSION OF THE INSTITUTE

VISION

To emerge as a center of excellence by providing industry oriented innovative technical education so that the products of the institution are able to combat the global challenges and contribute to the sustainable development of the society.

MISSION

To accomplish its unique vision, the Institute has a far-reaching mission that aims:

- ✓ To provide quality technical education through effective teaching learning process.
- ✓ To foster creativity, team work and problem-solving skills among the students.
- ✓ To collaborate with industry for hands-on training and employability.
- ✓ To nurture skill based entrepreneurship oriented learning.
- ✓ To instill ethical values and social responsibilities.

VISION & MISSION OF THE INSTITUTE

VISION

To cultivate a learning environment centered on core Computer Science and Engineering discipline, nurturing diploma engineers capable of adapting to technological changes and contributing to sustainable societal development by designing ethical technological solutions.

MISSION

To provide a modern, application-focused technical education in Computer Science and Engineering that encourages critical problem-solving, robot industry partnerships, entrepreneurial mindset, and ethical technological development.

- ✓ Deliver rigorous, application-oriented Computer Science and Engineering education.
- ✓ Foster innovation and practical problem-solving skills through hands-on experience.
- ✓ Forge strong partnerships with industry for curriculum relevance and real-world exposure.
- ✓ Install professional ethics and a spirit of entrepreneurship in future engineers.

PROGRAM EDUCATIONAL OBJECTIVES (PEOs)

COMPUTER SCIENCE & ENGINEERING DEPARTMENT

01

DIPLOMA ENGINEERS WILL POSSESS A STRONG FOUNDATION IN CORE COMPUTER SCIENCE AND ENGINEERING PRINCIPLES, ENABLING THEM TO ANALYZE, DESIGN, AND IMPLEMENT EFFECTIVE COMPUTING SOLUTIONS FOR REAL-WORLD APPLICATIONS.

02

DIPLOMA ENGINEERS WILL BE EMPLOYABLE IN VARIOUS DOMAINS OF INFORMATION AND COMMUNICATION TECHNOLOGY, DEMONSTRATING ADAPTABILITY TO TECHNOLOGICAL ADVANCEMENTS AND A COMMITMENT TO LIFELONG LEARNING.

03

DIPLOMA ENGINEERS WILL EXHIBIT PROFESSIONALISM, TEAMWORK, EFFECTIVE COMMUNICATION, AND ETHICAL RESPONSIBILITY WHILE CONTRIBUTING TO SUSTAINABLE SOCIETAL AND TECHNOLOGICAL DEVELOPMENT.

04

DIPLOMA ENGINEERS WILL DEMONSTRATE INNOVATION AND AN ENTREPRENEURIAL MINDSET, UTILIZING THEIR TECHNICAL SKILLS TO INITIATE OR CONTRIBUTE TO SELF-SUSTAINING VENTURES.

ABOUT COMPUTER SCIENCE AND ENGINEERING DEPARTMENT

Computer science & Engineering, a branch of engineering that turns ideas into solutions using logic, technology, and creativity. Its main aim is to develop technical skills and logical thinking in students. The department focuses on building a strong foundation in computing while also keeping students connected with modern technologies.

Students are introduced to core subjects such as programming, data structures, databases, web technologies. Along with classroom teaching, equal importance is given to practical learning through computer labs, projects, and hands-on sessions that help students apply concepts in real situations. Through workshops, technical activities, certifications, and project work, the department encourages continuous learning and practical exposure.

With a balance of theory and practice, the Department of Computer Science aims to prepare students for higher studies, industry opportunities, and responsible careers in the field of technology.

PRINCIPAL'S DESK

My Dear Students,
Success is built through consistency, resilience, and a calm belief in one's own potential. This magazine reflects that spirit a collection of disciplined effort, creativity, and quiet determination. Each contribution reminds us that true growth happens when we strive with focus, integrity, and purpose. Challenges may come, but confidence and hard work turn them into opportunities. As you read these pages, let it inspire you to stay grounded, think clearly, and move forward with grace and strength. Keep learning, keep improving, and carry yourself with dignity in every step you take toward your dreams. The journey ahead is yours to shape.

I congratulate HOD, Teaching and Non-Teaching staff, editorial board and students of the Computer Science and Engineering Department for bringing the "Code & Beyond" Wish you All The Best.

With Regards.

Dr. Thakur Sanjay Kumar
Principal
G. P. Muzaffarpur

ACADEMIC DEAN'S DESK

We are extremely pleased to bring out the Magazine of Computer Science and Engineering of our institution GP Muzaffarpur. This is one of the premier technical institutions in Bihar. It has the proud privilege of being the centre of quality education laying utmost thrust on practical as well as theoretical education. With the paradigm shift

in technical education, with the changing demand of industry, we groom our students in such a way that they are able to face the challenges posed by rapid revolution in the field of technology.

Since the students enrolled in our institute come from remote rural areas, they are often found lacking in effective communication skill. For this purpose we have a modern language Lab wherein students are trained to enrich their communication skill, in order to install confidence in our students we organise debate, extempore elocution competition regularly. We feel elated to say that our effort has born fruits. The sound technical knowledge of our products anchored by their effective communication skill has made our institute the fond destination of many a private firm.

We are still striving for a brighter future of our institute. We are confident under the able leadership of our Principal Dr. Thakur Sanjay Kumar who leaves no stone unturned for the betterment of the institute, we shall climb greater heights in days to come.

In course of our endeavor to bring out this magazine we owe obligations to many. First of all we are extremely grateful to our Principal Dr. Thakur Sanjay Kumar whose constant guidance and encouragement has been a perennial source of inspiration. We are also thankful to our learned teachers and students for their valuable suggestion and contribution without which we have never been able to give shape to this magazine

Dr. Sudhir Prasad Singh
Academic Dean
G. P. Muzaffarpur

FROM THE HOD'S DESK

Dear Students,

It gives me immense pleasure to witness the publication of our departmental magazine.

A dedicated space conceived and brought to life by the students and faculty of the Computer Science and Engineering (CSE) Department, Government Polytechnic Muzaffarpur.

While our curriculum rigorously trains students in coding and algorithms, we recognize that true excellence requires more than technical skill. This magazine serves as a crucial platform to celebrate the unseen talents of our students, their creativity and literary flair.

To our students, always remember:

"Be a continuous learner. Technology will change rapidly, but your ability to adapt and solve complex problems will be your greatest professional asset."

By providing an outlet for creative expression, this magazine helps our budding engineers develop essential soft skills, which are directly transferable to successful system design. I am confident this initiative will play a vital role in the holistic development of every student.

I wish everyone a path filled with innovation and success!

Mr. Suman Shekhar
HOD(Computer Science
& Engineering

Message *From The* EDITOR

It is my great pleasure to present before you the current yearly edition to you all.

Thanks to my editorial team, honorable staff members and all those to whom who with their loving and sincere efforts make this happen.

The magazine focus on relevant question on how AI will be going to impact jobs in next 5-10 years and finally giving safe solution to the question as well.

Other highlights of the magazine are glimpse of our campus life from classroom to various clubs which allows you to meet like-minded people, pursue various interests, build long-lasting connections with mentors and peers, and develop a strong skill set that can help you in your post-college career.

Beyond the Classroom: Learning in the Age of AI

“The future belongs not to those who know everything, but to those who never stop learning.”

Artificial Intelligence is changing the way we learn. Answers that once took hours to find are now available in seconds. But education has never been only about finding answers—it is about learning how to think.

AI can explain concepts, generate ideas, and solve problems, but it should be a learning partner, not a shortcut. The real skill lies in questioning what we receive, understanding it, and using it creatively.

As technology evolves, knowledge alone will not be enough. Curiosity, critical thinking, creativity, and adaptability will define tomorrow's learners.

The tools may change, but the ability to learn will always remain valuable.

**Don't just learn to use AI.
Learn to think beyond it.**

Voices of Experience

Engineering)

Language Modelling in AI

Introduction

Language modelling is one of the most important areas of Artificial Intelligence (AI) and Natural Language Processing (NLP). It enables computers to understand, generate, and work with human language. From chatbots and virtual assistants to machine translation and text-generation systems, language models form the foundation of many modern AI applications.

A language model is a computational system that learns patterns in language and uses those patterns to predict or generate text. In simple terms, it learns what words or symbols are likely to appear together based on the context in which they occur.

What Is Language Modelling?

Language modelling is the process of building a model that can predict the probability of a sequence of words or tokens. For example, if a model receives the sentence:

«“The sun rises in the _.”»

it can predict that “east” is a likely word to complete the sentence.

Traditional language models generally worked with individual words and their surrounding context. Modern models use tokens, which can represent words, parts of words, or characters. This allows them to handle large and complex vocabularies more efficiently.

Voices of Experience

Mathematically, a language model estimates the probability of a sequence of tokens:

$$P(w_1, w_2, \dots, w_n)$$

This can be broken down into the probability of each token given the tokens that came before it. By learning these probabilities from large amounts of text, the model develops an understanding of language patterns.

Types of Language Models

Language models have developed significantly over time. Some major types include:

1. Statistical Language Models

Early language models used statistical techniques such as n-grams. An n-gram model predicts a word based on a fixed number of preceding words.

For example, a trigram model might predict a word using the two words immediately before it. Although useful, these models struggled with long-range relationships and required large amounts of memory to store word combinations.

2. Neural Language Models

Neural language models use artificial neural networks to learn language patterns. They can represent words and their relationships using numerical vectors called embeddings.

Neural networks made it possible to capture more complex relationships than traditional statistical models.

Voices of Experience

3. Recurrent Neural Network Models

RNNs, including LSTMs and GRUs, were designed to process sequences of information. They could remember information from earlier parts of a sentence and use it to predict later words.

However, traditional RNNs could have difficulty retaining information across very long sequences.

4. Transformer-Based Language Models

Transformers revolutionized language modelling by introducing the attention mechanism, which allows a model to consider different parts of an input sequence when processing a particular token.

Transformer-based models can be trained efficiently on very large datasets and are capable of handling complex linguistic relationships. Many modern large language models (LLMs) are based on the Transformer architecture.

How Language Models Are Trained

Language models are trained using large collections of text, often called datasets or corpora. During training, the model processes text and learns to predict missing or subsequent tokens.

For example:

Input: “Artificial intelligence is changing the _.”

Expected prediction: “world”

The model compares its prediction with the expected result and adjusts its internal parameters to reduce the error. This process is

Voices of Experience

repeated many times across enormous quantities of data.

Modern language models can contain millions, billions, or even more parameters. These parameters are adjusted during training so that the model becomes increasingly capable of recognizing patterns in language.

Applications of Language Modelling

Language modelling has many practical applications.

Chatbots and virtual assistants: Language models allow AI systems to respond to questions and participate in conversations.

Machine translation: They help systems translate text between different languages.

Text generation: Language models can generate articles, summaries, stories, emails, and other forms of text.

Text summarization: They can identify important information and produce shorter versions of documents.

Question answering: Language models can process questions and generate relevant answers.

Speech and language applications: Language modelling is also used in systems that convert speech to text and improve the accuracy of spoken-language recognition.

Voices of Experience

Advantages of Language Models

Language models offer several important advantages:

- They can process and generate human-like text.
- They can identify complex patterns in language.
- They can work with large quantities of information.
- They support many applications across education, business, research, and communication.
- Modern models can perform multiple language-related tasks using a single system.

Challenges and Limitations

Despite their capabilities, language models have important limitations. They can sometimes produce incorrect or misleading information, a problem often referred to as hallucination. Their outputs can also reflect biases present in their training data.

Training large models requires substantial computational resources, electricity, data, and time. Privacy, copyright, fairness, transparency, and responsible use are also important concerns.

AI for Academics: Developing Thinkers, Creators and Responsible Engineers

Artificial Intelligence (AI) is rapidly becoming an important part of modern education. Tools such as ChatGPT, Google Gemini, Microsoft Copilot, Perplexity, NotebookLM and Grammarly can help students understand difficult concepts, practise problems, explore new ideas and improve their academic work. However, the real value of AI is not in getting quick answers; it is in using AI to develop the ability to think, create, question and solve problems independently.

For diploma students, AI can become a powerful academic partner when used correctly. Instead of asking AI, *“Give me the answer,”* students should ask, *“Give me a hint,”* *“Explain why this solution works,”* *“Show me different approaches,”* *“What are the limitations of my solution?”* or *“Challenge my idea with difficult questions.”* Such interaction encourages students to analyse problems rather than simply copy solutions. Students can first attempt a problem themselves and then use AI to identify mistakes, compare alternative approaches and improve their reasoning.

AI can also be used to develop creativity and innovation. A student can take a real-life problem— such as water wastage, agricultural

Voices of Experience

difficulties, traffic management, energy conservation, waste disposal or accessibility for persons with disabilities—and ask AI to help identify the causes, stakeholders, possible technologies and alternative solutions. The student should then evaluate these ideas, select the most practical one and develop a prototype or project. In this way, AI becomes a brainstorming and feedback partner while the student remains the designer and decision-maker.

AI can support students in achieving the Program Outcomes (POs) of diploma engineering education. It can strengthen engineering knowledge by providing explanations and examples; develop problem-analysis skills through case studies and troubleshooting; encourage design and development by suggesting alternative solutions; improve investigation skills by helping students frame research questions and analyse data; and enhance the use of modern engineering tools. AI-assisted discussions, presentations and collaborative projects can also improve communication, teamwork, project management and lifelong learning. Most importantly, students can learn to consider society, safety, environment and sustainability while designing engineering solutions.

For example, a computer engineering student could use AI to understand programming concepts, debug code and explore algorithms, but should write and test the program independently. An electrical student could use AI to understand circuit behaviour and troubleshoot possible faults. A mechanical student

Voices of Experience

could brainstorm design alternatives and analyse the advantages and limitations of different mechanisms. A civil engineering student could explore sustainable construction methods and compare materials. The objective should always be to move from “*AI gives me an answer*” to “*AI helps me build my own solution.*”

AI should also complement traditional learning. Online resources provide access to lectures, simulations, educational videos, documentation and current information. Offline learning through classrooms, laboratories, workshops, discussions with teachers and teamwork develops practical skills, discipline and human interaction. Books and textbooks remain essential because they provide structured, detailed and conceptually organised knowledge. The best learning model is therefore AI + teacher + books + online resources + laboratory/practical experience.

Ethical and Responsible Use of AI

Students must also understand that powerful technology requires responsible use. AI should not be used for cheating in examinations, submitting AI-generated assignments as one's own work, fabricating references or data, or copying another person's intellectual work. Students should disclose the use of AI when required by their institution or teacher and should verify important information before using it. Personal, confidential or sensitive information should not be unnecessarily entered into AI tools.

Students should also be aware of bias, misinformation, copyright

Voices of Experience

and academic integrity. AI-generated content may sound convincing but can still be wrong. Therefore, students should cross-check important facts using textbooks, reliable websites, research papers and guidance from teachers. The final responsibility for an assignment, project, design or decision always belongs to the student.

The ultimate goal of AI-enabled education is not to produce students who can obtain answers quickly. It is to develop engineers who can identify problems, think critically, generate creative solutions, work with modern technologies, communicate effectively and understand their responsibility towards society and the environment. When students use AI to question their assumptions, test their ideas, learn from mistakes and create solutions rather than merely copy answers, AI can become a powerful tool for achieving the complete potential of diploma engineering education.

The engineer of tomorrow should not ask, *“What can AI do for me?”* but rather, *“What can I create with AI to solve a problem faced by society?”*

CATEGORY:

Technology Oriented Project

ABOUT PROJECT:

Food Spoilage Detection is a machine-learning-based system developed to identify signs of spoilage in food items through image analysis. The system processes food images and predicts whether the food is fresh or spoiled, supporting better food quality monitoring and reducing wastage.

TECHNOLOGIES USED:

- Python
- Machine Learning
- OpenCV
- TensorFlow

RECOGNITION:

The project demonstrates the practical application of Artificial Intelligence and Computer Vision in food safety. Future improvements may include real-time camera detection and mobile application integration.
